

## **BAG-VALVE MASK**

### **Mask Sizes**

There are children and adult sizes.

### **Bag volume**

- 450 - 500 ml in children

- It should be 700 - 1000 ml in adults.

### **Practise:**

- In the nose should be adjusted from the level of the nose belt and in the mouth just above the chin. Do not press the eyes and the mask should not exceed the lower chin.
- The patient must be fitted with an airway prior to application.
- The mask should contain the mouth and nose.
- The mask should be kept by C-E technique.
- In the C-E technique, the mask is placed on the face with the thumb and index fingers. With other fingers, the jaw is grasped, and the head is positioned.
- Masks that do not fit well will cause air leakage, which prevents the patient from receiving 100% oxygen.
- If the patient has no head-neck-spine trauma or suspicion, the airway opening should be provided by giving head jaw position.
- Strong and fast ventilation should be avoided. You need to see the breast ventilation.
- Oxygen is attached to the back.
